

Display policy

What each seller sees:
natural: own + rival
hide-rival: rival = null
(four-arm study also
hides own or both)
No message channel

Two LLM sellers

Simultaneous prices
on {2.0, 2.5, ..., 6.5}
No sales, profit or
welfare is shown
Lowest price serves
demand; ties split

Joint trajectory

State (p_A, p_B)
Round 0: programmed
or model-chosen
Rounds 1-29: model
Assessed: 10-29
Block: arms matched

T1 Market outcome

$m, W, CS, \text{industry profit}$

T2 Joint structure

ties, transitions, persistence

T3 Allocation

T3a capture | T3b division

T4 Strategic harm

Gate on target tie (p, p):
(i) profit > grid Nash
(ii) profitable deviation
(iii) $p \leq 5.5$ (joint profit)
+ deviation, response
rule, counterfactual
Observed 6.0 / 6.5 ties
fail (iii): not identified

Closed loop: controlled-initial run (380/384 trajectories), replication (376/384),
four-arm study (44/48 blocks). Single shot: fixed-history diagnostic (1,458 units).

Blind spot of a T1-only monitor, e.g.
(6.0, 6.0) vs (6.0, 6.5): both $W = 311.1$

Certificate; $D_{\text{tie}} = 0.83$;
capture start: -27.9 W

X1 / X2 null at 6.0 tie;
Q-learning positive control
